在抛物线 $\mathcal{L}(\theta) = \frac{1}{2}\lambda\theta^2$（$\lambda = 10$）上的梯度下降
$\eta < 2/\lambda$（收敛）
$\eta\lambda = 1.5 < 2$
$\eta > 2/\lambda$（发散）
$\eta\lambda = 3 > 2$
$\eta = 2/\lambda$（稳定边界）
$\eta\lambda = 2$
$\theta_{t+1} = \theta_t - \eta\lambda\theta_t$
$= (1 - \eta\lambda)\,\theta_t$
$\mathcal{L}(\theta)$
θ
